PROJECT REPORT

CSE0001 · DIGITAL LITERACY

Winter Semester: 2025–2026

Student Digital Ambassador Program

STUDENT DETAILS

Name of the Student:	Ashesh nath yadav
Register Number:	25BSA10068
Branch:	Artificial Intelligence and Machine Learning
Date:	31st March 2026

Introduction

We live in a time when knowing how to use technology meaningfully is not optional—it shapes everything from how we learn to how we work. Being chosen as a Student Digital Ambassador as part of the Digital Literacy course (CSE0001) at VIT Bhopal University pushed me to take this responsibility seriously.

In my role as a Digital Ambassador, I work to guide fellow students in building solid online profiles, practicing safe digital communication, and making the best use of tools available to them. This portfolio captures what I went through across five focused modules, each one teaching something genuinely useful.

Whether it was designing awareness content, setting up my digital presence, diving into coding platforms, practicing professional email communication, or learning how to stay safe online—every part of this project added something to my skill set. This report walks through each task, sharing what I did and what I took away from it.

Task 1: Digital Literacy Awareness Infographic

What I Created:

For Task 1, I put together a Digital Literacy Awareness Infographic on Canva, a free browser-based design tool that is genuinely easy to get started with. The infographic focuses on three core topics: (1) What Digital Literacy Means, (2) Safe Internet Practices, and (3) Professional Online Presence.

Design Description:

I went with a simple, modern template using a blue and white palette—it looks clean and professional without being overdone. The layout is split into three sections, with icons and brief bullet points to keep things readable. Some of what I included:

- A definition of digital literacy
- Five essential safe internet practices (strong passwords, two-factor authentication,etc.)
- Tips for maintaining a professional online presence on GitHub and LinkedIn

Reflection:

The hardest part was fitting everything onto one page without making it feel cluttered. I had to make some tough choices about what to keep and what to cut. One thing that really surprised me was how many free icons and templates Canva offers—it made the whole process much smoother than I expected. I came away from this task with a clearer sense of how visuals can communicate ideas far better than blocks of text. As a Digital Ambassador, this infographic will be something I can hand to classmates who want a quick overview of digital literacy basics.

Task 2: Build Your Student Digital Portfolio

Platforms I Chose

GitHub – I registered using my college email and set up a profile README repository under my username. It covers my name, branch (B.Tech Computer Science), current year, and what I am working toward in development. GitHub is where I plan to record all my coding work and build out a real portfolio.

LinkedIn – I added a professional headline and filled in the Education section with VIT Bhopal University, my degree details, and expected graduation in 2029. LinkedIn is going to be my main tool for staying connected with alumni and people working in the industry.

Kaggle – I set up an account and wrote a short bio covering my studies and interest in data science. Kaggle is useful because it has free courses and real datasets to practice with.

How I Plan to Use Them

My plan over the next four years is to keep GitHub updated with all my projects, use LinkedIn to connect and share milestones, and work on data skills through Kaggle. Between the three, I think they cover most of what I need to build a credible online presence while still in college.

Task 3: Explore Coding & Collaboration Platforms

Part A – Coding Platform

I signed up on HackerRank and worked through two challenges: Compare the Triplets and A Very Big Sum. In Compare the Triplets, I wrote code to compare two three-element arrays element by element and tally the scores. For A Very Big Sum, I used Python's built-in sum() function to handle numbers too large for a 32-bit integer. Both problems helped me get better at array thinking, writing conditionals, and structuring code in a way that automated systems can evaluate.

Part B – Google Forms

I built a Digital Literacy Awareness Quiz with five questions spanning key topics: what digital literacy actually means, how to stay safe online, which platforms are useful for professional networking, email etiquette basics, and how to spot phishing attempts. I mixed multiple-choice and short-answer formats to capture different kinds of understanding. I also linked the form to Google Sheets so responses get collected automatically, which makes it much easier to go through later.

Reflection

HackerRank is something I want to keep using to stay sharp with coding and get ready for interviews down the line. Google Forms turned out to be way more flexible than I thought—it works well for surveys, quizzes, and collecting feedback. Both are free and easy to use, which matters a lot as a student. What I really got from this task is a sense of how the same digital tools can serve both personal growth and building something useful for others.

Task 4: Poor Digital Communication Scenario

Scenario:

A student who needed extra time on an assignment sent an email to their professor, but the subject line just said "Help!" and opened with "Hey." There was no mention of which

course, which assignment, or why more time was needed. The professor found it too casual and denied the request.

What Could Have Been Done Differently:

A subject line like "Extension Request: CSE0001 Assignment" would have been far more effective. Starting with "Dear Professor [Name]" and giving a short, honest explanation of the situation would have set the right tone. Adding the course code, registration number, and a specific date would have shown that the student was thinking it through properly.

Key Takeaway:

How you communicate says a lot about how seriously you take things. Something as small as a subject line or the way you open an email can change how it lands. A clear, polite message shows respect for the person you are writing to—and that usually makes a difference in how they respond.

Task 5: Cybercrime Awareness Case Study & Prevention Guide

What Surprised Me Most

When I dug into UPI fraud for this case study, the first thing that struck me was how simple these scams actually are. I had always pictured cybercrime as something highly technical, but most of it just comes down to playing on people's emotions—making them feel rushed, excited, or scared. Finding out that college students are a prime target because we use UPI so frequently and tend to be less suspicious was unsettling. The idea that a single moment of not paying attention—just entering your PIN without checking what it is for—can empty your account in seconds was something that really stayed with me.

One Habit I Will Personally Change

I used to enter my UPI PIN without really thinking about it. I never properly checked who I was paying or how much. Going through this case study made me realize that fraudsters disguise payment requests as verification steps to trick people. From now on, I will always read the transaction details first, and I will keep reminding myself of something simple: you only need your UPI PIN when you are sending money, not to verify or receive anything. I am also switching on two-factor authentication everywhere I can.

Conclusion

Looking back, this project has been one of the more meaningful learning experiences I have had. Each of the five tasks pushed me to actually do something—design an infographic, set up real profiles, write code, build a quiz, and think critically about online safety. I came to realize that digital literacy is not just about knowing which apps to use; it is about how you carry yourself online, how you communicate, and how aware you are of the risks. Coming out of this as a Student Digital Ambassador, I feel genuinely ready to help my peers find their footing in the digital world. My GitHub repository will be an ongoing record of everything I build from here on out.
